

## Installation manual

# KTM 690 E/SMC/R HEAT SHIELD

As you can see on pictures below, the holes on the header pipe where the heat shield is mounted are not round but oval, therefore the nut can be moved left and right. This enables you to install the carbon heat shield with ease.

If you have to install the third carbon heat shield (upmost front), it is important whether you have metal bars welded onto the header or not. For more details see the pictures below.

holders for header **without** metal bars

holders for header **with** metal bars
