

Installation manual

SEAT COOLER

The content of the package consists of:

- two pieces of foam rubber A
- eight pieces of rubber edge protection B
- two Nylon cable ties C
- two carbon side panels (left side - D and right side - E)

Remove the seat and unscrew the two Torx screws (A) shown on the picture, one on each side of the bike.

Place the carbon Seat Cooler panel between the tank and the frame in the front. In the rear place it between the cover and the frame. Screw both of the Torx screws back in.

Push one piece of foam rubber A between the tank and the carbon Seat Cooler panel on each side (see pictures below).

Put 3 small rubber pieces (B) on the edge of the carbon panel where it touches the frame in order to prevent direct contact between the carbon panel and the frame.

Fasten each carbon Seat Cooler panel with the one of the included cable ties C on each side of the motorcycle (shown on the picture to the left).

Enjoy the new look of your bike and safe riding!
